Creator and Brand Platform

Business Plan, Product Strategy, Roadmap, and Data Model

Built for influencers, small brands, and a path to enterprise

Prepared October 2026. Treat all prices, targets, and regulatory points as working assumptions to validate with customers, an accountant, and a privacy lawyer.

1. Executive Summary

The platform is a creator-first business tool that helps influencers find, pitch, onboard, and nurture brand partners, and helps small brands track creator sales, pay creators, and manage campaigns. It starts with the creator pipeline and brand onboarding, adds attribution and payouts, and grows into agency and enterprise tiers on a shared data model.

The core bet is that global partner management software is built for enterprise channel programs, while small brands and creators in the Philippines are served by spreadsheets, chat threads, and manual payouts. The gap is simple tooling with local payouts, local tax documents, and Taglish-friendly, mobile-first workflows, backed by AI insights that explain their reasoning.

Revenue comes from creator subscriptions (freemium), brand subscriptions and modules, a small take rate on payouts, optional marketplace fees, and later agency and enterprise contracts. The first milestone is 20 to 30 committed pilot users before the full build begins.

2. Market and Competitive Landscape

Partner relationship management (PRM) software manages indirect partners who sell on a company's behalf. A PRM is different from a CRM, which manages direct customer relationships. Most leading PRMs were built for enterprise channel programs. The table below summarizes the platforms most consistently named in 2026 rankings.

Platform	Best known for	Advantages	Limitations for your market
Impartner	Large, structured partner programs	Highest overall scores in a 2025 Channel Insider evaluation; strong onboarding, enablement, deal registration, lifecycle automation	Enterprise-heavy, portal-centric, less flexible for co-selling; pricing hidden behind sales
Salesforce PRM (Partner Cloud)	Companies already on Salesforce	Native CRM integration, highly customizable, Einstein AI insights	Needs admin skill; cost and complexity are high for small teams
ZINFI	End-to-end channel lifecycle	Broad suite covering recruitment to channel marketing; strong G2 rating	Rigid workflows; built for programs with many partners across tiers
PartnerStack	SaaS referral and affiliate partners	Automated payouts, partner community, known for ease of use	Oriented to SaaS; limited local payout and tax support
Allbound (now Channelscaler)	Partner portals for mid-market teams	Clean interface, content delivery, mobile-friendly portal	Built for resellers, not individual creators

Adjacent categories include affiliate networks such as impact.com, influencer marketing platforms, and e-commerce affiliate programs inside Shopee, Lazada, and TikTok Shop. None of these combines creator-side pipeline management, brand onboarding, and local payouts in one simple product.

Positioning: be the simple, local, creator-first system of record for creator-brand deals, and grow toward enterprise on the same data model.

3. Product Scope

3.1 Creator side: personal deal pipeline

- **Pipeline board** with stages: Lead, Pitched, Negotiating, Onboarded, Active, Repeat Client, Lost.
- **Brand records** with decision-maker contacts, estimated deal value, next action, and due dates.
- **Outreach templates** for cold pitches, follow-ups, and rate replies, with merge fields.
- **Follow-up reminders** and an activity log across email, WhatsApp, Messenger, calls, and meetings.
- **Media kit generator** from the creator profile, with a shareable link and view tracking.

- **Brand discovery and fit scoring** based on audience overlap, category match, and past collaborations.
- **Nurture tools**: check-in reminders, relationship health scores, seasonal campaign calendar (9.9, 11.11, 12.12, back-to-school, Christmas), and re-pitch suggestions.
- **Income forecast** from pipeline value, win probability, and retainers.

3.2 Brand onboarding flow

When a brand agrees to work with a creator, the creator sends a branded onboarding link. The brand submits business details (company name, TIN, business permit, registration documents), billing contacts, product and brand guidelines, the campaign brief and deliverables, usage rights and exclusivity terms, and shipping details for samples. The creator receives everything in one place instead of chasing details across chat threads.

3.3 Contracts, invoicing, and payouts

- Contract templates with e-signature, capturing signer, time, IP address, and user agent.
- Invoices with the creator's TIN, sequential numbering, and withholding tax fields.
- Payouts to GCash, Maya, bank transfer, and PayPal, with batch processing.
- BIR Form 2307 certificate tracking for creators whose brands withheld tax.
- Overdue invoice reminders and payment status tracking.

3.4 Brand side: campaign, attribution, and PRM

- **Creator recruitment** and a searchable creator directory.
- **Campaign management**: briefs, deliverables, draft approvals, deadlines, and proof-of-post capture (link or screenshot).
- **Attribution**: unique links and discount codes per creator, matched to orders from Shopify, Shopee, Lazada, TikTok Shop, and WooCommerce.
- **Commission rules** by percentage, flat fee, or cost per acquisition, recorded in a ledger so payouts are auditable.
- **Fraud and quality checks**: follower anomalies, suspicious engagement, duplicate or self-referral accounts.
- **Ad disclosure checks** for sponsored labels, and warnings for regulated categories such as health and supplements.
- **Product gifting logistics** with courier tracking (J&T, Lalamove).

3.5 AI insights

AI is part of the core workflow, and every insight shows the factors behind it so users can trust and challenge it. Users can rate insights, and that feedback improves future versions.

User	AI features
Creators	Deal prioritization by likelihood to close; pitch drafts from the brand's recent campaigns (creator edits before sending); best follow-up day and channel; rate range suggestions from engagement, niche, and comparable deals; income forecast with concentration risk; content performance explanations
Brands	Creator matching by audience fit and cost per engagement; fraud and quality flags; campaign summaries with rebook or drop recommendations
Enterprise	Portfolio analytics across regions and product lines; anomaly alerts; compliance review of drafts against brand guidelines

Guardrails: keep humans in the loop for pitches and contracts, show reasoning on every insight, and collect explicit consent for AI analysis under the Philippine Data Privacy Act (RA 10173).

4. Architecture and Enterprise Readiness

The product is built for small customers now, with foundations that let enterprise features be turned on without redesign.

- **Multi-tenant data model:** every business is an organization, and every query is scoped to it.
- **Row-level security** in PostgreSQL to enforce tenant isolation at the database layer.
- **Role-based permissions:** owner, admin, manager, member, and viewer, expandable later.
- **Audit logs** recording who changed what and when, partitioned by month.
- **API and webhooks** for integrations such as Shopify, Shopee, HubSpot, and Salesforce.
- **SSO-ready authentication** using a provider that supports SAML and OIDC.
- **Data export and deletion** to meet privacy obligations and enterprise procurement requirements.
- **Modular packaging** so AI, payouts, attribution, and analytics can be sold separately.

5. Schema and Data Model

Four design decisions shape the schema. First, every business is an organization, whether creator, brand, agency, or enterprise. Second, private creator data (notes, rate negotiations, activity logs) is kept separate from shared data (the brand directory and what a brand submits during onboarding). Third, money is stored as integers in minor units (centavos) with a currency code, and commissions are recorded as ledger entries rather than mutable balances. Fourth, every relationship is scoped by organization, which RLS enforces.

5.1 Entity groups

Group	Tables
Identity and tenancy	users, organizations, memberships, subscriptions
Profiles	creator_profiles, social_accounts, brand_profiles, brand_contacts
Creator-private pipeline	pipeline_entries, pipeline_contacts, activities
Onboarding and documents	onboarding_requests, onboarding_submissions, documents
Contracts and campaigns	contracts, contract_signatures, campaigns, deliverables
Attribution and money	tracking_links, orders, attributions, commission_rules, commissions, payout_methods, payouts, payout_items, invoices, tax_certificates
Intelligence and compliance	ai_insights, ai_feedback, consents, audit_logs

5.2 Core DDL (excerpt)

The full schema covers all tables above. The excerpt below shows the representative patterns: tenancy, the private pipeline, idempotent orders, and the commission ledger.

```
-- Tenancy
CREATE TYPE org_type AS ENUM ('creator', 'brand', 'agency', 'enterprise');

CREATE TABLE organizations (
  id               uuid PRIMARY KEY DEFAULT gen_random_uuid(),
  type             org_type NOT NULL,
  name             text NOT NULL,
  tin              text,              -- encrypted at the app layer
  country          char(2) NOT NULL DEFAULT 'PH',
  default_currency char(3) NOT NULL DEFAULT 'PHP',
  created_at       timestamptz NOT NULL DEFAULT now()
);

-- Creator-private pipeline (visible only to the creator org)
CREATE TYPE pipeline_stage AS ENUM
  ('lead','pitched','negotiating','onboarded','active','repeat','lost');

CREATE TABLE pipeline_entries (
  id               uuid PRIMARY KEY DEFAULT gen_random_uuid(),
  creator_org_id   uuid NOT NULL REFERENCES organizations(id),
  brand_org_id     uuid REFERENCES organizations(id),  -- set once brand joins
  brand_name       text NOT NULL,                      -- snapshot
  stage            pipeline_stage NOT NULL DEFAULT 'lead',
  est_value_minor  bigint,                             -- centavos
  currency         char(3) NOT NULL DEFAULT 'PHP',
  win_probability  numeric(3,2),
  next_action      text,
  next_action_due  timestamptz
);

-- Idempotent order ingestion for webhook retries
CREATE TABLE orders (
  id               uuid PRIMARY KEY DEFAULT gen_random_uuid(),
  brand_org_id     uuid NOT NULL REFERENCES organizations(id),
  source_platform  text NOT NULL,  -- shopify | shopee | lazada | tiktok_shop
  external_order_id text NOT NULL,
  gross_minor      bigint NOT NULL,
  currency         char(3) NOT NULL,
  placed_at        timestamptz NOT NULL,
  UNIQUE (source_platform, external_order_id)
);

-- Commission ledger: one row per earned amount
CREATE TABLE commissions (
  id             uuid PRIMARY KEY DEFAULT gen_random_uuid(),
```

```
  creator_org_id uuid NOT NULL REFERENCES organizations(id),
  brand_org_id   uuid NOT NULL REFERENCES organizations(id),
  campaign_id    uuid NOT NULL,
  amount_minor   bigint NOT NULL,
  currency       char(3) NOT NULL,
  status         text NOT NULL DEFAULT 'accrued', -- accrued|approved|paid|reversed
  accrued_at     timestamptz NOT NULL DEFAULT now()
);

-- A commission is paid at most once
CREATE TABLE payout_items (
  payout_id     uuid NOT NULL,
  commission_id uuid NOT NULL UNIQUE,
  PRIMARY KEY (payout_id, commission_id)
);
```

5.3 Row-level security

```
ALTER TABLE pipeline_entries ENABLE ROW LEVEL SECURITY;

CREATE POLICY creator_only ON pipeline_entries
  USING (creator_org_id = current_setting('app.current_org')::uuid);
```

Apply the same pattern to activities, onboarding_requests, and commissions, with policies that let the brand side see only rows involving it. Test these policies automatically, because one missing policy would expose one creator's notes to another.

5.4 Key indexes

```
CREATE INDEX ON pipeline_entries (creator_org_id, stage, next_action_due);
CREATE INDEX ON activities (pipeline_entry_id, occurred_at DESC);
CREATE INDEX ON orders (brand_org_id, placed_at);
CREATE INDEX ON attributions (tracking_link_id);
CREATE INDEX ON commissions (creator_org_id, status);
CREATE INDEX ON ai_insights (org_id, subject_type, subject_id, generated_at DESC);
```

6. Roadmap

Move between phases by meeting success criteria, not by calendar date. The timeline below is a planning guide.

Phase	Timing	Scope	Success criteria
0. Validation	Months 0 to 2	Interview 30 to 50 creators and 15 to 20 brands. Build a clickable prototype. Test willingness to pay. Pick the wedge.	20 to 30 paying or committed pilot users; clear pricing signal
1. Creator pipeline and onboarding MVP	Months 2 to 5	Pipeline board, outreach templates, follow-up reminders, brand onboarding link, media kit, basic invoicing, GCash/Maya/bank payouts, AI pitch drafts and follow-up timing	200 creators; 50 brands onboarded; monthly active deal use
2. Attribution and campaigns	Months 5 to 8	Unique links and codes, order matching (Shopify, Shopee, Lazada), deliverables and proof-of-post, AI rate suggestions and performance summaries	10 brands paying for attribution; sales visible by creator
3. Brand PRM and marketplace	Months 8 to 12	Full brand dashboard, creator discovery and matching, fraud checks, BIR Form 2307 tracking, AI matching and fraud flags	100 brands; 2,000 creators; marketplace-originated deals
4. Mid-market and agencies	Months 12 to 18	Agency accounts across many creators and brands, team roles, shared pipelines, approval workflows, white-label reports, HubSpot integration	10 to 20 agencies on paid plans
5. Enterprise	Month 18 onward	SAML/OIDC SSO, audit logs, data residency options, admin controls, portfolio analytics, anomaly alerts, compliance review, SLAs	3 to 5 enterprise pilots, then conversions

7. Business Model

The model lets creators start free, makes brands pay for measurable value, and uses enterprise contracts to fund the larger build.

Revenue stream	Who pays	Starting assumption (validate in Phase 0)
Creator subscription	Creators	Free: up to 10 active brands, basic media kit, manual invoicing. Pro: about PHP 299 to 499 per month, unlimited brands, AI tools, automated follow-ups. Creator Business: about PHP 999 per month, forecasting, team members, analytics
Brand subscription and modules	Brands	Starter: a few hundred to a few thousand PHP per month (onboarding, campaign tracking). Growth: full PRM, matching, fraud checks. Modules for attribution, AI insights, and compliance
Payout take rate	Brands or creators (transparent fee)	1 to 3 percent of payouts processed, or a flat fee per payout
Marketplace referral fee	Brands (optional for creators)	5 to 10 percent of the first campaign value on marketplace-originated deals
Agency and enterprise contracts	Agencies, enterprises	Agency plans per seat or per managed creator; annual enterprise contracts with SSO, SLAs, integrations
Professional services	Enterprises	Onboarding and custom integrations, charged separately
Aggregated benchmarks (later)	Brands, agencies	Anonymized category rate and performance reports, only with explicit consent and privacy safeguards

7.1 Unit economics to track

- **Creator CAC:** keep low through referrals. Creators invite other creators when the tool saves them time.
- **Brand CAC:** higher, because brands convert more slowly. Use creator success stories as proof.
- **Take rate:** track payout volume and fee revenue together.
- **Net revenue retention:** measure whether brands expand module usage over time.
- **Brand payback period:** target under 12 months.

7.2 Network design decision

Decide early who pays. If creators are the paying customer, brands should be free to join so the network stays populated. A brand onboarded by one creator can later be pitched by another, which strengthens both sides of the platform.

8. Risks and Mitigations

Risk	Mitigation
Payment integration approvals (GCash, Maya)	Start with bank transfers and manual payout exports, then add integrations as partners approve
Creators unwilling to pay	Validate in Phase 0; keep a useful free tier that proves value before the first paid conversion
Platform API changes (Shopee, TikTok, Meta)	Build integrations as modules with a manual CSV import fallback
Tax and compliance errors	Engage an accountant before launching payouts or tax documents
Personal data handling under RA 10173	Consent flows, data-use policy, export and deletion, encryption of TINs and account references; consult a privacy lawyer
AI quality and trust	Human review for pitches and contracts; visible reasoning; user feedback loop
Long enterprise sales cycles	Fund the build with creator, brand, and agency revenue until enterprise deals close

Risk	Mitigation
Multi-tenant data leaks	Row-level security plus automated policy tests on every release

9. First 90 Days Checklist

- Week 1 to 2: recruit 30 creators and 15 brands for interviews. Prepare a one-page script covering tracking, payouts, and follow-up pain points.
- Week 2 to 4: complete interviews and write a summary of the top three pains and willingness to pay.
- Week 3 to 6: build a clickable prototype of the pipeline board and onboarding link. Test with 10 creators.
- Week 4 to 8: consult an accountant on withholding tax and Form 2307 rules, and a privacy lawyer on RA 10173 consent and data handling.
- Week 6 to 10: choose the wedge (attribution plus payouts, or pipeline). Recruit 20 creators and 10 brands for a paid or committed pilot.
- Week 10 to 13: set up the database with the schema in Section 5, enable row-level security with tests, and start Phase 1 build.
- Track weekly: pilot sign-ups, active deals, payout volume, and willingness-to-pay evidence.

Disclaimer: This plan uses general market information and planning assumptions rather than verified financial, legal, or tax advice. Confirm pricing, tax treatment, and data privacy obligations with qualified professionals before launch.
